

Checkers

in three dimensions

A player's manual

“Sit down, spin the board, and take your turn.”

What's inside:

How to move the camera around the table

How a turn works, from selection to capture

The rules the game enforces — forced captures, chained jumps, kings

Built with [three.js](#) · Rendered for the table, not the screen

Welcome to the table

This is checkers rendered as a small tabletop object rather than a flat grid of icons: a walnut and maple board lit like a room you could sit down in, cream and onyx pieces with real weight to them, and a walnut-side opponent who never keeps you waiting for a second player. This manual covers how to move the camera, how a turn works, and the house rules the game enforces for you.

You always play the cream pieces. The walnut pieces play themselves, moving a few moments after your turn ends.

The board and the camera

The board is fixed in place, but you can move around it freely, the way you would lean over a real table to see a diagonal more clearly.

Drag	Click and drag anywhere on the board to orbit the camera around it. Drag left and right to circle the table, up and down to rise above it or lean in closer.
Scroll	Use the scroll wheel, or a two-finger scroll on a trackpad, to move the camera closer to or farther from the board.
Click	A single click, without dragging, selects a piece or confirms a move. If the camera moves while you click, the game treats it as a drag, not a move.

Taking a turn

It is always your move when the status panel in the top right reads **Your move**. Play proceeds in three simple steps.

1. Click one of your cream pieces.
2. Its legal destinations light up on the board with a soft green ring, and the piece itself is marked with a brass ring.
3. Click a lit square to move there. If you change your mind, click a different piece of yours instead.

Once your move is made, the walnut side replies on its own after a short pause, and the status panel returns control to you.

The rules, as the game enforces them

The game follows standard American checkers rules and will not let you make an illegal move. Here is what that means at the board.

Captures are mandatory

If any of your pieces can jump an opposing piece, you must make a jump on your turn — you cannot choose a quiet move instead. Only pieces with a jump available will highlight when you have no other legal option; the status panel will tell you if you have picked a piece that isn't the one with the available capture.

Jumps can chain

When a jump lands your piece in a position to jump again immediately, you are required to continue jumping with that same piece before your turn ends. The board will keep lighting up further capture squares, and the status panel will read **Continue the jump with the same piece** until no further capture is available.

Kings

A piece that reaches the far row of the board is crowned on the spot, gaining a small brass ring on top. Kings move and capture diagonally in any of the four directions, forward or backward, while ordinary pieces may only move toward the opposite side of the board.

Winning and losing

A side wins by capturing every one of the opponent's pieces, or by leaving the opponent with no legal move at all on their turn. When either happens, the game announces the result and offers a new game.

Reading the status panel

The panel in the top right always shows whose move it is, with a small dot in that side's colour, and a running count of pieces remaining for each side underneath. A line of finer text beneath the turn indicator carries situational notes — for instance, that a capture is required, or that a jump must continue.

Starting over

The **New game** button in the top right resets the board to its starting position at any time, cream to move first. The same button reappears at the centre of the board once a game has ended.

Good luck at the table.
